Earth reinforcing techniques are increasingly becoming a useful, powerful and economical solution to various problems encountered in geotechnical engineering practice. Expansion of the experiences and knowledge in this area has succeeded in developing new techniques and their applications to geotechnical engineering problems. In order to discuss the latest experiences and knowledge, and with the purpose of spreading them all over the world for further development, the IS Kyushu conference series on the subject of earth reinforcement have been held in Fukuoka, Japan, every four years since 1988. This fourth symposium, entitled "Landmarks in Earth Reinforcement", is a continuation of the series of IS Kyushu conferences, and also aims at being one of the landmarks in the progress of the modern earth reinforcement practice.

The first volume of the proceedings contains texts of 137 papers selected for this symposium. The papers are arranged under five categories which cover almost all aspects in the area of earth reinforcement.

The second volume contains texts of the special and keynote lectures, reports of special session on "Soil Nailing" and summary discussion session on "Design Procedure", and chairpersons reports of technical and discussion sessions. The report of ISSMGE/TC-9 activities during the period of 1997-2001 will be also included.
